# Amazon Fine Food Reviews Analysis

Data Source: https://www.kaggle.com/snap/amazon-fine-food-reviews

EDA: https://nycdatascience.com/blog/student-works/amazon-fine-foods-visualization/

The Amazon Fine Food Reviews dataset consists of reviews of fine foods from Amazon.

Number of reviews: 568,454
Number of users: 256,059
Number of products: 74,258
Timespan: Oct 1999 - Oct 2012
Number of Attributes/Columns in data: 10

Attribute Information:

1. Id
2. ProductId - unique identifier for the product
3. UserId - unqiue identifier for the user
4. ProfileName
5. HelpfulnessNumerator - number of users who found the review helpful
6. HelpfulnessDenominator - number of users who indicated whether they found the review helpful or not
7. Score - rating between 1 and 5
8. Time - timestamp for the review
9. Summary - brief summary of the review
10. Text - text of the review

**Objective:**

Given a review, determine whether the review is positive (rating of 4 or 5) or negative (rating of 1 or 2).

[Q] How to determine if a review is positive or negative?

[Ans] We could use Score/Rating. A rating of 4 or 5 can be cosnidered as a positive review. A rating of 1 or 2 can be considered as negative one. A review of rating 3 is considered nuetral and such reviews are ignored from our analysis. This is an approximate and proxy way of determining the polarity (positivity/negativity) of a review.

# [1]. Reading Data

## [1.1] Loading the data

The dataset is available in two forms

1. .csv file
2. SQLite Database

In order to load the data, We have used the SQLITE dataset as it is easier to query the data and visualise the data efficiently.

Here as we only want to get the global sentiment of the recommendations (positive or negative), we will purposefully ignore all Scores equal to 3. If the score is above 3, then the recommendation wil be set to "positive". Otherwise, it will be set to "negative".

# [2] Exploratory Data Analysis

## [2.1] Data Cleaning: Deduplication

It is observed (as shown in the table below) that the reviews data had many duplicate entries. Hence it was necessary to remove duplicates in order to get unbiased results for the analysis of the data. Following is an example:

In [11]:

```
display= pd.read_sql_query("""
SELECT *
FROM Reviews
WHERE Score != 3 AND UserId="AR5J8UI46CURR"
ORDER BY ProductID
""", con)
display.head()
```

Out[11]:

| | Id | ProductId | UserId | ProfileName | HelpfulnessNumerator | HelpfulnessDenominator | Score | Time | Summ |
|---|---|---|---|---|---|---|---|---|---|
| 0 | 78445 | B000HDL1RQ | AR5J8UI46CURR | Geetha Krishnan | 2 | 2 | 5 | 1199577600 | LOACK QUADRAT VANI WAFE |
| 1 | 138317 | B000HDOPYC | AR5J8UI46CURR | Geetha Krishnan | 2 | 2 | 5 | 1199577600 | LOACK QUADRAT VANI WAFE |
| 2 | 138277 | B000HDOPYM | AR5J8UI46CURR | Geetha Krishnan | 2 | 2 | 5 | 1199577600 | LOACK QUADRAT VANI WAFE |
| 3 | 73791 | B000HDOPZG | AR5J8UI46CURR | Geetha Krishnan | 2 | 2 | 5 | 1199577600 | LOACK QUADRAT VANI WAFE |
| 4 | 155049 | B000PAQ75C | AR5J8UI46CURR | Geetha Krishnan | 2 | 2 | 5 | 1199577600 | LOACK QUADRAT VANI WAFE |

As it can be seen above that same user has multiple reviews with same values for HelpfulnessNumerator, HelpfulnessDenominator, Score, Time, Summary and Text and on doing analysis it was found that

ProductId=B000HDOPZG was Loacker Quadratini Vanilla Wafer Cookies, 8.82-Ounce Packages (Pack of 8)

ProductId=B000HDL1RQ was Loacker Quadratini Lemon Wafer Cookies, 8.82-Ounce Packages (Pack of 8) and so on

It was inferred after analysis that reviews with same parameters other than ProductId belonged to the same product just having different flavour or quantity. Hence in order to reduce redundancy it was decided to eliminate the rows having same parameters.

The method used for the same was that we first sort the data according to ProductId and then just keep the first similar product review and delelte the others. for eg. in the above just the review for ProductId=B000HDL1RQ remains. This method ensures that there is only one representative for each product and deduplication without sorting would lead to possibility of different representatives still existing for the same product.

In [0]:

```
#Sorting data according to ProductId in ascending order
sorted_data=filtered_data.sort_values('ProductId', axis=0, ascending=True, inplace=False, kind='qui
cksort', na_position='last')
```

In [13]:

```
#Deduplication of entries
final=sorted_data.drop_duplicates(subset={"UserId","ProfileName","Time","Text"}, keep='first', inpl
ace=False)
final.shape
```

Out[13]:

```
(4986, 10)
```

In [14]:

```
#Checking to see how much % of data still remains
(final['Id'].size*1.0)/(filtered_data['Id'].size*1.0)*100
```

Out[14]:

```
99.72
```

**Observation:-** It was also seen that in two rows given below the value of HelpfulnessNumerator is greater than HelpfulnessDenominator which is not practically possible hence these two rows too are removed from calcualtions

In [15]:

```
display= pd.read_sql_query("""
SELECT *
FROM Reviews
WHERE Score != 3 AND Id=44737 OR Id=64422
ORDER BY ProductID
""", con)

display.head()
```

Out[15]:

| | Id | ProductId | UserId | ProfileName | HelpfulnessNumerator | HelpfulnessDenominator | Score | Time | Summary |
|---|---|---|---|---|---|---|---|---|---|
| **0** | 64422 | B000MIDROQ | A161DK06JJMCYF | J. E. Stephens "Jeanne" | 3 | 1 | 5 | 1224892800 | Bought This for My Son at College |
| **1** | 44737 | B001EQ55RW | A2V0I904FH7ABY | Ram | 3 | 2 | 4 | 1212883200 | Pure cocoa taste with crunchy almonds inside |

In [0]:

```
final=final[final.HelpfulnessNumerator<=final.HelpfulnessDenominator]
```

In [17]:

```
#Before starting the next phase of preprocessing lets see the number of entries left
print(final.shape)

#How many positive and negative reviews are present in our dataset?
final['Score'].value_counts()
```

```
(4986, 10)
```

Out[17]:

```
1    4178
0     808
Name: Score, dtype: int64
```

# [3] Preprocessing

## [3.1]. Preprocessing Review Text

Now that we have finished deduplication our data requires some preprocessing before we go on further with analysis and making the prediction model.

Hence in the Preprocessing phase we do the following in the order below:-

1. Begin by removing the html tags
2. Remove any punctuations or limited set of special characters like , or . or # etc.
3. Check if the word is made up of english letters and is not alpha-numeric
4. Check to see if the length of the word is greater than 2 (as it was researched that there is no adjective in 2-letters)
5. Convert the word to lowercase
6. Remove Stopwords
7. Finally Snowball Stemming the word (it was obsereved to be better than Porter Stemming)

After which we collect the words used to describe positive and negative reviews

In [18]:

```
# printing some random reviews
sent_0 = final['Text'].values[0]
print(sent_0)
print("="*50)

sent_1000 = final['Text'].values[1000]
print(sent_1000)
print("="*50)

sent_1500 = final['Text'].values[1500]
print(sent_1500)
print("="*50)

sent_4900 = final['Text'].values[4900]
print(sent_4900)
print("="*50)
```

```
Why is this $[...] when the same product is available for $[...] here?<br
/>http://www.amazon.com/VICTOR-FLY-MAGNET-BAIT-REFILL/dp/B00004RBDY<br /><br />The Victor M380 and
M502 traps are unreal, of course -- total fly genocide. Pretty stinky, but only right nearby.
==================================================
I recently tried this flavor/brand and was surprised at how delicious these chips are.  The best t
hing was that there were a lot of "brown" chips in the bsg (my favorite), so I bought some more th
rough amazon and shared with family and friends.  I am a little disappointed that there are not, s
o far, very many brown chips in these bags, but the flavor is still very good.  I like them better
than the yogurt and green onion flavor because they do not seem to be as salty, and the onion flav
or is better.  If you haven't eaten Kettle chips before, I recommend that you try a bag before buy
ing bulk.  They are thicker and crunchier than Lays but just as fresh out of the bag.
==================================================
Wow.  So far, two two-star reviews.  One obviously had no idea what they were ordering; the other
wants crispy cookies.  Hey, I'm sorry; but these reviews do nobody any good beyond reminding us to
look  before ordering.<br /><br />These are chocolate-oatmeal cookies.  If you don't like that com
bination, don't order this type of cookie.  I find the combo quite nice, really.  The oatmeal sort
of "calms" the rich chocolate flavor and gives the cookie sort of a coconut-type consistency.  Now
let's also remember that tastes differ; so, I've given my opinion.<br /><br />Then, these are soft
, chewy cookies -- as advertised.  They are not "crispy" cookies, or the blurb would say "crispy,"
rather than "chewy."  I happen to like raw cookie dough; however, I don't see where these taste li
ke raw cookie dough.  Both are soft, however, so is this the confusion?  And, yes, they stick toge
ther.  Soft cookies tend to do that.  They aren't individually wrapped, which would add to the
cost.  Oh yeah, chocolate chip cookies tend to be somewhat sweet.<br /><br />So, if you want
something hard and crisp, I suggest Nabiso's Ginger Snaps.  If you want a cookie that's soft, chew
y and tastes like a combination of chocolate and oatmeal, give these a try.  I'm here to place my
second order.

# [5] Assignment 11: Truncated SVD

1. **Apply Truncated-SVD on only this feature set:**

   - SET 2:Review text, preprocessed one converted into vectors using (TFIDF)

   - **Procedure:**
     - Take top 2000 or 3000 features from tf-idf vectorizers using idf_ score.
     - You need to calculate the co-occurrence matrix with the selected features (Note: X.X^T doesn't give the co-occurrence matrix, it returns the covariance matrix, check these bolgs blog-1, blog-2 for more information)
     - You should choose the n_components in truncated svd, with maximum explained variance. Please search on how to choose that and implement them. (hint: plot of cumulative explained variance ratio)
     - After you are done with the truncated svd, you can apply K-Means clustering and choose the best number of clusters based on elbow method.
     - Print out wordclouds for each cluster, similar to that in previous assignment.
     - You need to write a function that takes a word and returns the most similar words using cosine similarity between the vectors(vector: a row in the matrix after truncatedSVD)

### [5.2] Calulation of Co-occurrence matrix

In [0]:

```python
# Please write all the code with proper documentation
```

In [0]:

```python
window=2
co_occur_matrix = np.zeros([2002,2002])
```

In [0]:

```python
for sentence in X_train:
    words_in_sent=sentance.split()
    for i,word in enumerate(words_in_sent):
```

```
    for i,word in enumerate(words_in_sent):
        if word in top_2000:
            for j in range(max(i-window,0),min(i+window,len(words_in_sent)-1)+1):
                #if preprocessed_reviews[i] in top_n and X_train[i]!=word:
                if words_in_sent[j] in top_2000 and words_in_sent[j]!=word:
                    co_occur_matrix[top_2000.index(words_in_sent[j]),top_2000.index(word)]+=1
```

In [69]:

```
print(co_occur_matrix)
```

```
[[0. 0. 0. ... 0. 0. 0.]
 [0. 0. 0. ... 0. 0. 0.]
 [0. 0. 0. ... 0. 0. 0.]
 ...
 [0. 0. 0. ... 0. 0. 0.]
 [0. 0. 0. ... 0. 0. 0.]
 [0. 0. 0. ... 0. 0. 0.]]
```

In [0]:

```

```

### [5.3] Finding optimal value for number of components (n) to be retained.

In [88]:

```
from sklearn.decomposition import TruncatedSVD

n_components=[10,20,50,60,100,200,300,400,500,1000]
explained_variance=[]
for nn in n_components:
    tsvd=TruncatedSVD(n_components=nn)
    tsvd.fit(co_occur_matrix)
    expvar=tsvd.explained_variance_ratio_.sum()
    explained_variance.append(expvar)
    print('n_components=',nn,'Explained variance=',expvar)
ax = plt.subplot(111)
explained_var=np.arange(0.1,1.1,0.1)
plt.plot(n_components,explained_var)
plt.title('Optimal Explained Variance Plot')
plt.xlabel('n_components')
plt.ylabel('Explained Variance')
ax.legend("Explained Variance")
plt.show()
```

```
n_components= 10 Explained variance= 0.9119075385115525
n_components= 20 Explained variance= 0.9998246926419481
n_components= 50 Explained variance= 1.0000000000000024
n_components= 60 Explained variance= 1.0000000000000033
n_components= 100 Explained variance= 1.0000000000000027
n_components= 200 Explained variance= 1.000000000000002
n_components= 300 Explained variance= 1.000000000000002

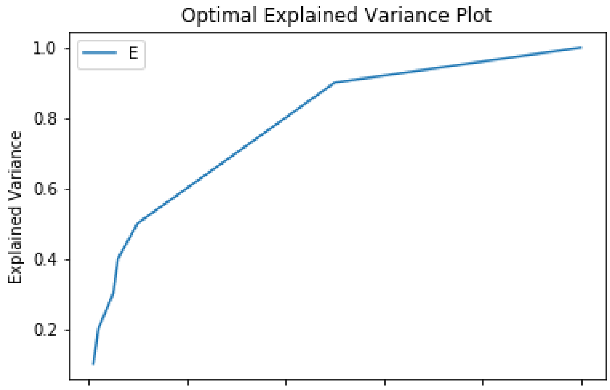
n_components= 500 Explained variance= 1.0000000000000016
n_components= 1000 Explained variance= 1.0000000000000027
```



### [5.4] Applying k-means clustering

In [0]:

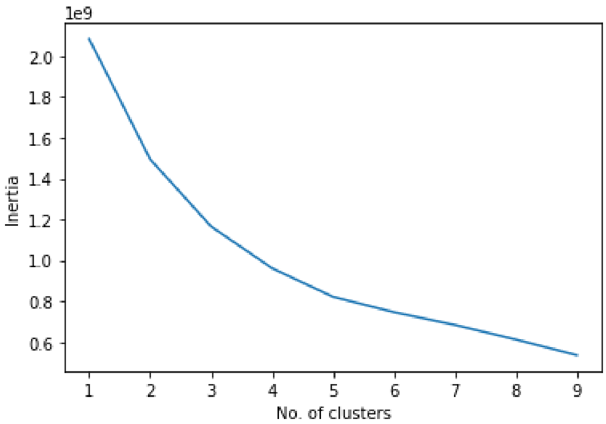
```
tsvd=TruncatedSVD(n_components=150)
co_occur_mat=tsvd.fit_transform(co_occur_matrix)
```

In [0]:

```
# Please write all the code with proper documentation
from sklearn.cluster import KMeans
```

In [109]:

```
inertias = []
K = range(1,10)
dic = {}
for i in K:
    model = KMeans(n_clusters = i)
    model.fit(co_occur_mat)
    dic[i] = model.inertia_
plt.plot(list(dic.keys()), list(dic.values()))
plt.xlabel("No. of clusters")
plt.ylabel("Inertia")
plt.show()
```



In [0]:

```
optimal_k = KMeans(n_clusters = 4)
pp = optimal_k.fit(co_occur_mat)
```

In [0]:

```
cluster1,cluster2,cluster3,cluster4=[],[],[],[]
for i in range(pp.labels_.shape[0]):
    if pp.labels_[i] == 0:
        cluster1.append(preprocessed_reviews[i])
    elif pp.labels_[i] == 1:
        cluster2.append(preprocessed_reviews[i])
    elif pp.labels_[i] == 2:
        cluster3.append(preprocessed_reviews[i])
    else:
        cluster4.append(preprocessed_reviews[i])
```

### [5.5] Wordclouds of clusters obtained in the above section

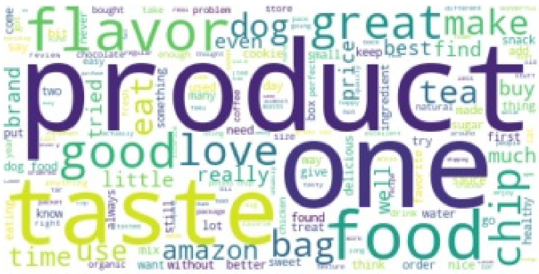
In [0]:

```
# Please write all the code with proper documentation
```

In [113]:

```
data=''
for i in cluster1:
    data+=str(i)
from wordcloud import WordCloud
wordcloud = WordCloud(background_color="white").generate(data)

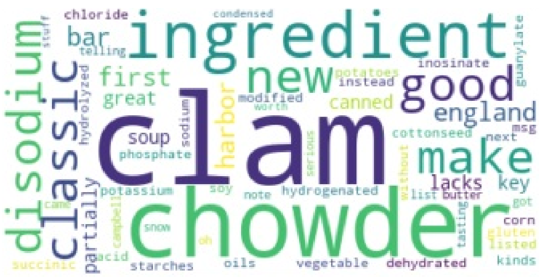
# Display the generated image:
plt.imshow(wordcloud, interpolation='bilinear')
plt.axis("off")
plt.show()
```



In [114]:

```
data=''
for i in cluster2:
    data+=str(i)
from wordcloud import WordCloud
wordcloud = WordCloud(background_color="white").generate(data)

# Display the generated image:
plt.imshow(wordcloud, interpolation='bilinear')
plt.axis("off")
plt.show()
```



In [115]:

```
data=''
for i in cluster3:
    data+=str(i)
from wordcloud import WordCloud
wordcloud = WordCloud(background_color="white").generate(data)

# Display the generated image:
plt.imshow(wordcloud, interpolation='bilinear')
plt.axis("off")
plt.show()
```

In [116]:

```
data=''
for i in cluster4:
    data+=str(i)
from wordcloud import WordCloud
wordcloud = WordCloud(background_color="white").generate(data)

# Display the generated image:
plt.imshow(wordcloud, interpolation='bilinear')
plt.axis("off")
plt.show()
```

### [5.6] Function that returns most similar words for a given word.

In [0]:

```
# Please write all the code with proper documentation
```

In [118]:

```
from sklearn.metrics.pairwise import cosine_similarity

def similarity(word):
    sim=cosine_similarity(co_occur_matrix)
    word_vector=sim[top_2000.index(word)]
    print("Similar Word to",word)
    index = word_vector.argsort()[::-1][1:11]
    for j in range(len(index)):
        print((j+1),"Word",top_2000[index[j]] ,"is similar to",word,"\n")

similarity(top_2000[2])
```

```
Similar Word to absolutely
1 Word flat is similar to absolutely

2 Word finally is similar to absolutely

3 Word find is similar to absolutely

4 Word finding is similar to absolutely

5 Word fine is similar to absolutely

6 Word fingers is similar to absolutely

7 Word finish is similar to absolutely

8 Word finished is similar to absolutely

9 Word firm is similar to absolutely

10 Word first is similar to absolutely
```

In [0]:

```

```

In [0]:

```

```

# [6] Conclusions

In [0]:

```
# Please write down few lines about what you observed from this assignment.
# Also please do mention the optimal values that you obtained for number of components & number of clusters.
```

**1)In this assignment we took TfIdf Vectorizer and we have reduced the complexity by reducing the dimensions to 2000.**
**2)We have found the "Explained Variance" using SVD and got the optimal number of n_components(reduced dimensions).**
**3)We can say that we computed the TfIdf Vectorizer's(or any) optimal number of dimensions using SVD. The dimensionality can be reduced to that extent.**
**4)After that we have fitted the data by the optimal dimension we got.**
**5)Later we've found the optimal clusters using KMeans and finally wrote a similarity function.**
